# Network Topology

# Network Topology

## Network

Address  
Range:192.168.0.1/24  
Netmask:  
255.255.255.240  
Gateway:192.168.1.1

## Machines

IPv4:192.168.1.8  
OS:Kali  
Hostname:Kali

IPv4:192.168.1.100  
OS:Ubuntu 18.04.3  
Hostname:  
Ubuntu Headless (ELK)

IPv4:192.168.1.105  
OS:Linux  
Hostname:Server 1  
(Target-Capstone)

The background of the slide is a dark red, almost black, field filled with a complex, repeating geometric pattern of triangles and polygons in various shades of red and maroon, creating a textured, crystalline effect.

# **Red Team** Security Assessment

# Recon: Describing the Target

---

Nmap identified the following hosts on the network:

Hostname	IP Address	Role on Network
Kali	192.168.1.8	Attacker Machine
Ubuntu Headless	192.168.1.100	Network Log Monitoring
Server 1	192.168.1.105	Target Machine

---

# Vulnerability Assessment

---

The assessment uncovered the following critical vulnerabilities in the target:

Vulnerability	Description	Impact
Directory List	The Directory List is viewable via using command line injection into a browser.	This can reveal sensitive data unless it requires extra authentication.
Weak Password or Weak Hash	Using a weak password such as: password, 123456, or anything that can easily be guessed.	An attacker can easily brute force the password using a common wordlist in a short amount of time.
Reverse Shell Attack	This attack uses a listener to lure the target machine into opening a file that will give the attacker access to the machine and allow control despite firewalls.	If shell.php was opened it allows the attacker to use a shell on the target machine and have access to any file on that machine.

---

# Exploitation: Directory List

01

## Tools & Processes

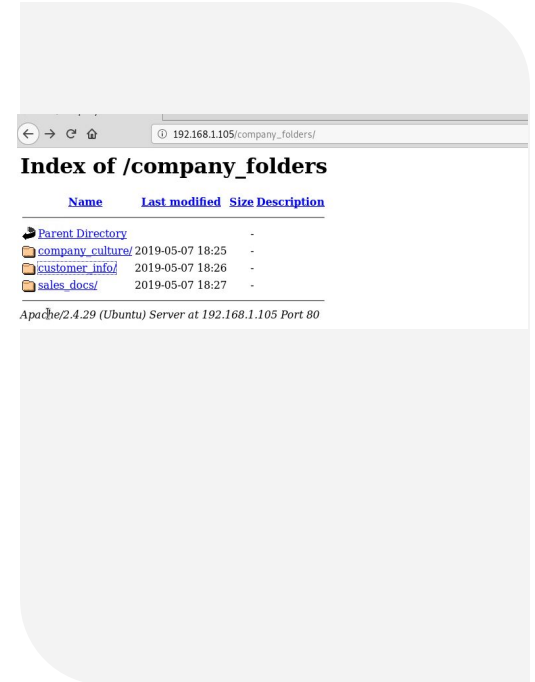

After a port scan using NMAP, I could access some of the directories using a web browser and command injection. The text files located in the directory showed a secret\_folder that could be accessed using a password.

02

## Achievements

This exploit allowed me to see information that led me to a secret folder. I also was able to find a path to upload the shell.php file to the directory.

03

# Exploitation: Weak Passwords and/or Weak Hashes

---

01

## Tools & Processes

Using Hydra and a custom wordlist I strung these two together on a command line and ran it against the hash that I found.

02

## Achievements

This exploit cracked the password using a brute force technique using hydra. This gave me access to a password protected directory.

03

```
root@kali:~# hydra -l ashton -P usr/share/wordlists/ -s 80 -f -vv 192.168.1.105
http-get/company folders/secret folder
hydra v8.6 (c) 2017 by van Hauser/THC - Please do not use in military or secret
service organizations, or for illegal purposes.
hydra (http://www.thc.org/thc-hydra) starting at 2021-11-30 21:00:47
```

# Exploitation: Reverse TCP Handler Exploit

---

01

## Tools & Processes

Using a msfconsole instance on the Kali machine I was able to run a process to monitor the

02

## Achievements

What did the exploit achieve?  
For example: Did it grant you a user shell, root access, etc.?

03

```
[*] Started reverse TCP handler on 192.168.1.8:4444
```

# **Blue Team**

## Log Analysis and Attack Characterization

# Analysis: Identifying the Port Scan

---

- The Request began at 01:20:20 on November 24th, 2021
- 4 packets were sent to the target machine
- This port scan is indicated by the use of port 80 and that it is qualified as network flow

```
> Nov 24, 2021 @ 01:14:10.138 @timestamp: Nov 24, 2021 @ 01:14:10.138 host.name: server1 type: flow
destination.ip: 192.168.1.105 destination.port: 80 destination.packets: 1
destination.bytes: 68B event.start: Nov 24, 2021 @ 01:14:08.349 event.end: Nov
24, 2021 @ 01:14:08.350 event.duration: 0.0 event.dataset: flow
event.kind: event event.category: network_traffic event.action: network_flow
```

# Analysis: Finding the Request for the Hidden Directory

---

- The request for the hidden directory was made November 5th, 2021 at 13:03:02. These files contained the important data used for logins on the WebDav directory.

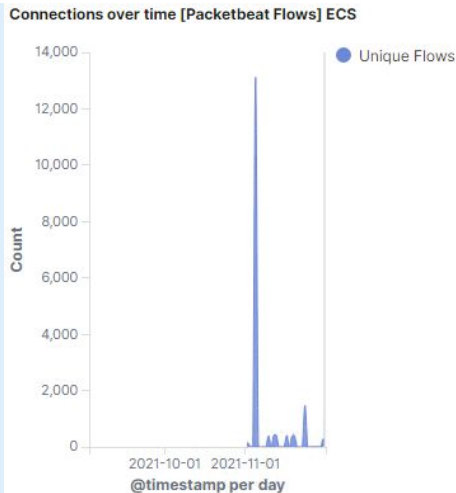

## Top 10 HTTP requests [Packetbeat] ECS

url.full: Descending ↕	Count ↕
http://192.168.1.105/company_folders/secret_folder	10,015
http://127.0.0.1/server-status?auto=	5,473
http://192.168.1.105/webdav/shell.php	33
http://192.168.1.105/webdav	23
http://169.254.169.254/2014-02-25/dynamic/instance-identity/document	19

# Analysis: Uncovering the Brute Force Attack

---

- There were 10,537 requests total.
- 10,536 requests before the password was discovered.

# Analysis: Finding the WebDAV Connection

---

- There were 33 total requests made to this directory.
- In this directory there was a .php file called shell.php that was used for this attack.

```
> Nov 24, 2021 @ 01:27:41.233 @timestamp: Nov 24, 2021 @ 01:27:41.233 http.request.method: get
http.request.referrer: http://192.168.1.105/webdav/ http.request.bytes: 415B
http.request.headers.content-length: 0 http.response.status_phrase: ok
http.response.status_code: 200 http.response.bytes: 204B
http.response.body.bytes: 2B http.response.headers.content-length: 2
```

# **Blue Team**

## Proposed Alarms and Mitigation Strategies

# Mitigation: Blocking the Port Scan

---

## Alarm

Create an alert that will trigger when a scan is used against the network. This alert should trigger after 1 event to make sure it is contained and assessed.

## System Hardening

Close ports and use a firewall. For example using firewalld in a command line argument: `firewalld-cmd --permanent --remove-port=80/tcp`

# Mitigation: Finding the Request for the Hidden Directory

---

## Alarm

An alarm or tripwire could be set for the directory to trap the attacker and report the IP address.

## System Hardening

Removing the directory from the web would be the first thing to do. If that isn't possible than setting a new password to the whole directory and giving access to only privileged users. Finally setting a tripwire in the directory would help to block the attacker before they can do damage.

# Mitigation: Preventing Brute Force Attacks

---

## Alarm

Setting an alarm in Splunk to report when someone is brute forcing passwords and setting the threshold to under 5.

## System Hardening

Setting up an alert through splunk that will send an email to the security team would help to harden against this vulnerability. Another way is setting requirements on the complexity of passwords and changing those passwords often.

# Mitigation: Detecting the WebDAV Connection

---

## Alarm

Setting an alarm that triggers anytime the directory is being accessed from outside the IP range of the company devices.

## System Hardening

Similarly to the hidden directory, setting an alarm for any outside IP addresses and only allowing certain IP addresses to the WebDav connection would harden it. Also implementing another tripwire would be an alternative to the first solution.

---

# Mitigation: Identifying Reverse Shell Uploads

---

## Alarm

Set an alert for any traffic coming through port 4444 and set alerts for any unknown file coming into the directory.

## System Hardening

- Uploads should require authorization from an admin.
- The server admin should restrict and ban any executable files from being uploaded.
- Disable ssh by commenting out port 22 in the sshd\_config file.

*The  
End*
